AB In the present study ozonized Me linoleate with peroxide index of 1,800 mmol-equiv kg⁻¹ was chemical characterized. Ozonation of Me linoleate produced hydroperoxides, ozonides and aldehydes which were identified by ¹H and ¹³C NMR 2-dimensional. The standard Me linoleate and ozonized Me linoleate shown very similar ¹H NMR spectra except for the signals at δ 9.7 and δ 9.6 that correspond to aldehydic hydrogen, δ 5.7 and δ 5.5 (olefinic signals from hydroperoxides) and δ 5.2 ppm (multiplet from ozonides methynic hydrogen). Other resonance assignments are based on the connectivities provided by the hydrogen scalar coupling consts. Thus, NMR spectroscopy can provide valuable information about the amount of formed

oxygenated compds. in the ozonized Me linoleate to use it to follow up
ozone therapy and chemical of ozonized vegetable oil.

AB Prior studies have proven that ozonized vegetable oils
present a high germicidal power. Ozonization of sunflower oil
at different applied ozone dosages was carried out and peroxide and
aldehydes indexes along with antimicrobial activity were determined. The
reaction products were identified using 1H NMR. The principal signals
intensity values were used for following the reaction course between ozone
and sunflower oil. The reaction was following up to peroxide index values
of 1202 mmol-equi/Kg. The intensities of olefinic proton signals
decreased with the gradual increase in ozone concentration but without
disappearing completely. The Criegee ozonides obtained at 107.1 mg/g
ozone doses were .apprx.3.9-fold higher than that at beginning of the
reaction. The aldehyde protons were observed as a weak intensity signal in
all the spectra. The signals belonging to olefinic protons from
hydroperoxides appeared weak and increased with the increase in
ozone doses. Signals from other oxygenated groups were assigned. The
highest action spectrum of antimicrobial activity was obtained with the
higher peroxide index. It was concluded that at higher applied ozone
doses, the higher the antimicrobial activity potential of ozonized
sunflower oil.

LANGUAGE: English

AB Ozonization reactions are very important in vegetable oil chemical since their ozonization products are involved in antimicrobial effect in therapeutical uses for several microbiol. etiol. diseases. Information on the spectroscopic characterization of the products generated by ozonolysis of sunflower oil is limited. In the present study ozonized sunflower oil with 650 mmol-equiv/kg of peroxide index is chemical characterized. Ozonization of sunflower oil produced ozonides, aldehydes and hydroperoxides which were identified by ^1H , ^{13}C and two-dimensional ^1H NMR. The virgin sunflower oil and ozonized sunflower oil show very similar ^1H NMR spectra except for the resonances at $\delta = 9.74$ and $\delta = 9.63$ ppm that correspond to both triplet from aldehydic protons, $\delta = 5.6$ ppm (olefinic signal from hydroperoxides), and $\delta = 5.15$ ppm (multiplet from ozonides methylic protons). Other resonance assignments are based on the connectivities provided by the proton scalar coupling consts. These are the following: $\delta = 3.15$ ppm (doublet from methylenic group in α position respect to olefinic proton), $\delta = 2.45$ ppm (multiplet from methylenic group allylic to ozonides methynic protons) and $\delta = 1.62$ ppm (multiplet methylenic protons in β position respect to ozonides methynic protons). From the ^{13}C NMR and ^1H - ^{13}C two-dimensional spectrum of the ozonized sunflower oil, the presence of ozonides was confirmed by the signals $\delta = 103.43$ and $\delta = 103.49$ ppm, resp. The others new signals found in $\delta = 42.5$ and $\delta = 42.76$ ppm confirm the presence of methylenic carbons from hydroperoxides and ozonides. These results indicate that NMR Spectroscopy can provide valuable information about the amount of reaction compds. of ozonized vegetable oil. From the chemical structural elucidation of ozonated sunflower oils, relevant biochem. and chemical information can be achieved.

AB The oils are produced by ozonization of vegetable oils and fats in a bubble reactor using ozone, O₃, or their mixts. in liquid phase at 30-50° to form the corresponding α -hydroxy-hydroperoxides. The vegetable oils include sunflower, cacao, olive, soybean, jojoba, coconut palm, canola, corn, sesame, thistle, linseed, castor, rice, sugarcane, pumpkin, peanut, and almond oils. The produces are suitable for use in chemical, pharmaceutical, and cosmetics industry, and possess bactericidal, virucidal, parasiticidal and fungicidal activity and do not show toxicol. or adverse reactions. The ozonized oils can be used in treatment of diseases, in skin revitalizing cosmetics formulations.
